---

The present study has been planned to investigate the beneficial effect of VGR - 2 in male sexual dysfunction cases. 48 diagnosed cases of premature ejaculation and erectile failure were selected for the clinical trial of VGR-2. Out of 48, 8 cases of premature ejaculation and 6 cases of erectile failure were given placebo in order to compare the results.

When VGR-2 was given along with GKM-022, a significant improvement was observed both in cases of erectile failure and premature ejaculation. Majority of the cases reported satisfactory improvement in the thickness and quantity of seminal fluid after the continuous use of this drug. GKM-022 has anxiolytic effects and this indicates that this drug may prove more beneficial in cases of male sexual inadequacy especially in cases of premature sexual ejaculation.
