---

Impotence is seen in almost half the number of male diabetic patients. The causes are many and may be due to metabolic, psychological, hormonal, neurological, iatrogenic or mixed reasons.

Although exogenous administration with male hormones could help, it is safer to opt for a natural based remedy, which would be effective and also free from undesirable side effects. In this trial one such remedy; ‘Strenex’ was assessed in a controlled clinical trial of 40 patients. A significant number of those who received ‘Strenex’ showed increase in Libido and performance, whereas only 2 out of 20 on placebo reported increase in Libido but not in performance. Testosterone levels were significantly raised in the patients put on ‘Strenex’.

It is concluded that Strenex will be of use in treating male impotence in diabetic as well as non-diabetic patients.
